PROFESSIONAL SUMMARY

Technical Operations Engineer with 4.5+ years of experience designing, automating, and managing scalable AWS cloud infrastructure. Hands-on expertise in CI/CD pipeline implementation, containerization, and Infrastructure as Code using Terraform. Experienced in ECS, EKS, Jenkins, and Docker to support secure, high-availability deployments — with additional depth in observability (Elastic APM, ELK stack) and Zero Trust access control across multi-environment production systems.

EDUCATION

Bachelor of Engineering (ECE) **2016-2020**
KalasalingamInstitute of Technology,Krishnankovil

TECHNICAL SKILLS

- Proficient in creating and managing AWS-based infrastructure, including EC2, VPC, EBS, IAM, AMI, ECR, ECS, WAF, EFS, S3, ELB, ALB, RDS, VPC peering, subnets, route tables, internet gateways, security groups, auto scaling, and CloudWatch.
- Hands-on expertise in designing and configuring Jenkins pipelines, integrating plugins, and establishing distributed build environments using master/agent architecture.
- Containerization & Orchestration: Experienced with Docker and Kubernetes (deployments, services, volumes, namespaces, secrets).
- Skilled in Infrastructure as Code (IaC) using Terraform to provision VPCs, EC2 instances, subnets, security groups, internet gateways, and load balancers.
- Proficient in creating Dockerfiles to build customized container images for various environments.
- Experienced with Git source control: branching, merging, resolving conflicts, and managing version history.
- Built automated CI pipelines that validate source code, run builds/tests, and notify stakeholders of issues.
- Hands-on experience installing and configuring Apache, Tomcat, PHP, and Cube.js across UAT, Preprod, and Production environments.

SOFTWARE PROFICIENCY

- **Operating Systems:** Ubuntu,Centos
- **Version Control Tools:** Git
- **CI/CD Tools:** Jenkins
- **Provisioning Tool:** Terraform
- **Configuration Management Tools:** Ansible
- **Containerization:** Docker, Kubernetes
- **Application Server:** Apache Tomcat
- **Build Tools**: Maven
- **Cloud Platform:** Amazon Web Services (AWS)
- **Monitoring Tool:** Zabbix,SigNoz

PROFESSIONAL EXPERIENCE

Senior Technical operations engineer **September 2021 – Present**
Pranion Technology Ventures Private Limited

- Provisioned and managed production AWS infrastructure (EC2, VPC, ECS, ECR, IAM, ALB, CloudFront, WAF) supporting high-availability workloads across multiple environments.
- Administered AWS EKS clusters, deploying microservices using Kubernetes manifests with rolling updates, implementing resource limits, HPA/Karpenter auto-scaling, and secure secrets management to ensure high availability and optimized resource utilization.
- Installed and configured Jenkins with plugin integration,security setup, and master-agent architecture.
- Implemented CI/CD pipelines for 10+ applications using GitHub, Jenkins, Maven, and SonarQube — delivering to AWS ECR,ECS and EKS across UAT, Pre-prod, and Production
- Authored optimized multi-stage Dockerfiles for Java, Node.js, and PHP applications, reducing image sizes and standardizing containerization across all services.
- Setup and manage PostgreSQL & MySQL database environments, including AWS RDS version upgrades and automated backup shell scripts, ensuring seamless migrations and reliable data management.
- Implemented zero-downtime deployments on ECS by triggering rolling updates with existing task definitions, ensuring uninterrupted service through ALB health checks and container restarts.
- Implement AWS WAF in production, integrated with ALB and CloudFront to protect against web attacks.
- Performed AWS EKS cluster version upgrades, including control plane and node groups, ensuring application compatibility, zero downtime deployments, and cluster stability.
- Migrated Amazon RDS PostgreSQL databases across AWS accounts using snapshots and cross-account sharing, ensuring zero data loss and minimal downtime.
- Configured CI/CD pipelines for Laravel, Java Spring Boot, and Node.js apps using Jenkins across UAT, Preprod, and Prod environments.
- Monitor Variour Linux Server Health of different parameters (System Load, Hard disk, Apacherequests, CPU load average) and Databases via Zabbix server .
- Analyze and troubleshoot application logs,swiftly identifying and resolving issues to maintain optimal system performance.
- Implemented Elastic APM integrated with ELK stack to monitor multi-language applications (Java, Laravel, Node.js, Python), enabling real-time transaction tracing and performance monitoring.
- Configured Warpgate as a Zero Trust SSH and database access gateway with RBAC and audit logging across Dev, UAT, Pre-prod, and Production — eliminating direct credential exposure and replacing traditional bastion hosts
